SUMMARY

Full-Stack Developer experienced in delivering production web and mobile systems across frontend, backend, databases, authentication, payments, automation, and SEO. Built end-to-end product features using TypeScript, Next.js, React Native, Node.js, Supabase, and PostgreSQL, including a 76-endpoint education platform integrated with a production database serving approximately 150,000 accounts.

EXPERIENCE

Konten.com

June 2026 – Present

Full-Stack Developer

- Strengthened account security by implementing single-device session enforcement with Supabase GoTrue and server-side validation, automatically invalidating older sessions and displaying a clear frontend re-authentication prompt when an account is accessed from another device.
- Built a seven-day consecutive-login onboarding system with Rp15,000 reward eligibility, community follow-up actions, and a guided product walkthrough covering profile completion, campaign discovery, brief review, video upload, and withdrawal.
- Developed a weekly Clipper leaderboard and five-tier progression system for Base, Verified, Certified, Professional, and Elite Clippers, combining view thresholds, 0–20% campaign bonuses, monthly rank reviews, and a Duolingo-inspired animated interface.
- Improved platform reliability by standardizing API error handling and user-facing responses, replacing inconsistent modal implementations with reusable Figma-based components, and resolving 32 low- and medium-priority bugs.
- Built an SEO-ready blog system using dynamic metadata, structured data, automatically generated tables of contents from H2 headings, and FAQ schema to improve content crawlability and rich-result eligibility.
- Automated daily Discord activity reports through cron jobs, Konten.com backend APIs, and webhooks, publishing four platform-wide metrics—total clips, earnings, views, and paid clippers every day at 18:00 to increase community visibility.

Key Achievements

- Enforced one active session per account across backend and frontend authentication flows, providing immediate user notification and a clear sign-in recovery path when another device invalidates the session.
- Resolved 32 platform bugs while consolidating legacy modal, popup, and error-feedback implementations into reusable components with consistent behavior and styling.
- Delivered two fully responsive, animation-rich landing pages directly from Figma in three total development days: Konten.com within two days and Kelas Clipper within one day.

Kelas Clipper

Backend Developer

- Built the Kelas Clipper backend domain from scratch using Express.js and strict TypeScript, delivering 76 endpoints across student and admin workflows, 22 PostgreSQL tables, and 23 additive migrations on a shared production database serving approximately 150,000 Konten.com accounts.
- Unified authentication across Konten.com and Kelas Clipper through a single Supabase GoTrue

tenant and public.users source of truth, enabling existing users to sign in directly while automatically provisioning clipper accounts, wallets, and roles for email/password, Google PKCE, and payment-based registrations.

- Prevented inconsistent access states by deriving four class-access phases—trial, trial expired, active, and expired—at read time, then centralized authorization through four typed route tiers with fail-closed 503 behavior when database validation was unavailable.
- Secured the 24-hour trial and paid-subscription lifecycle using compare-and-set activation, Rp0 audit orders, idempotent Xendit invoice and webhook processing, callback-token validation, double-entry ledger records, and renewal calculations based on max(now, access_until).
- Protected curriculum integrity by implementing permanent module-unlock latches, server-side task revalidation, hidden quiz answers, and monotonic output tracking from tracked_videos, while synchronizing Discord roles idempotently without allowing Discord failures to block student requests.
- Automated operational workflows through PDF certificate issuance with public QR verification, 14 audited admin overrides, six runtime configuration parameters, and cross-repository API documentation built from real backend responses instead of TypeScript types alone.

Key Achievements

- Delivered approximately 12,200 lines of strict TypeScript, 76 endpoints, 22 PostgreSQL tables, and 23 production-safe migrations independently within one week.
- Reduced Bootcamp map database round-trips from 42 queries to 3 and parallelized four queries on a request path previously measured at approximately 1.7 seconds.
- Reduced generated certificate size from 3.39 MB to 0.54 MB (approximately 84%) and identified six frontend-backend contract mismatches that had passed type checking in both repositories.

PT. Berkas Indah Garment (DRX)

May 2025 – June 2026

Full-Stack Developer

- Contributed to **three live production products (DRX Token, Wear, Sportnet)**, working across frontend, backend services, and CMS admin dashboards within existing architectures.
- Built the Padel Hub feature end to end for the DRX Sportnet mobile application, developing the frontend with React Native and backend services with HonoJS on Bun, Prisma ORM, and PostgreSQL.
- Improved search visibility across DRX platforms by developing SEO-optimized Next.js interfaces with Tailwind CSS and shadcn/ui, implementing dynamic metadata, Open Graph, and JSON-LD structured data.
- Developed scalable backend services using NestJS, Prisma, and PostgreSQL, supporting content lifecycle management, admin workflows, modular data schemas, and production-ready mobile features.
- Improved application reliability and performance by introducing structured 2xx/4xx/5xx error handling for legacy services, removing unused code, and optimizing rendering and assets while retaining the video-based hero section.
- Standardized frontend and backend development by refactoring repeated interfaces into reusable components, managing shared user, session, filter, and modal state through React Context API, implementing a searchable HonoJS Audit Trail, and documenting services with Swagger/OpenAPI.

Key Achievements

- Improved Google PageSpeed Insights scores from approximately 50–60 to 80–90 through code

cleanup, rendering optimization, asset optimization, and legacy-code refactoring.

- Established shared frontend, backend, and CMS standards across three production products, reducing duplicated logic and setup time by 30%.
- Improved system traceability, admin accountability, SEO coverage, and cross-team integration through structured audit logging, monitoring, metadata validation, JSON-LD, and comprehensive OpenAPI documentation.

Hallo Hukum

February – May 2025 (Contract, Completed)

Frontend Developer

- Converted wireframes into responsive UIs for two React Native (Expo) apps (client & lawyer).
- Integrated Stream real-time chat + voice/video and auth flows, shipped a stable release with 0 blocking issues.
- Optimized rendering and state management, improving UI responsiveness by 25% across devices.
- Implemented JWT/OAuth access control and session management, securing 100% of protected features.
- Collaborated with backend in agile sprints with clean PRs/tests, delivering 100% of planned scope on schedule.

ExplorePulau.id

March – April 2025

Web Developer & SEO Recovery Freelance

- Rescued site from a gambling-spam hack: removed injected files and cleaned infected server.
- Hardened security and restructured the file system, improving load stability and reducing attack surface.
- Improved SEO visibility by removing spam-indexed URLs from Google Search Console.

PROJECTS

TypeSynq Royale — Full-Stack Web3 Developer

- Built a real-time multiplayer typing battle game with WebSocket synchronization using [Multisynq](#).
- Implemented **on-chain betting and reward distribution** via smart contracts on the Monad Testnet.
- Integrated **AI-generated word themes and game settings** (word count, time limit, and word theme) based on host configuration.
- Achieved **Top 6 placement** in the official **Monad Game Hackathon**.
Tech stack: React.js, TypeScript, Vite, Multisynq, Solidity (Monad Testnet), Hardhat, Ethers.js, Wagmi, RainbowKit, Tailwind CSS, Gemini, MongoDB

Satria Gear — Full-Stack Developer & AI Automation Engineer

- Built a full tournament platform with public pages for tournament information, schedules, brackets, teams, live streams, and participant registration, reducing manual event coordination.
- Developed an admin dashboard to manage tournaments, official teams, rosters, payments, matches, live scores, brackets, streams, settings, and admin users from one centralized operational system.
- Implemented registration-to-payment automation using Midtrans, webhook handling, payment status synchronization, Supabase, and Resend confirmation emails.
- Delivered match and bracket operations including round/stage setup, best-of scoring, winner/loser tracking, bracket slot progression, official team visibility, and public schedule/bracket updates.
- Integrated AI Agent (Hermes), Discord, GitHub Actions, Vercel deploy logs, failure-only mentions, repo audit, Codex prompt generation, and approval-based production safety rules.

Key Achievements:

- Reduced deploy failure triage time by automating GitHub/Vercel failure alerts to Discord and enabling AI Agent to identify likely root causes, related files, risks, and Codex fix prompts.
- Reduced manual tournament operations by centralizing registration, payment, team validation, match scoring, bracket updates, and stream management into a single admin dashboard.
- Built an AI-assisted DevOps workflow with 6 agent rule documents and 4 ops documents, enabling Jalu to audit deploy failures, read repo context, generate Codex prompts, and avoid unsafe production actions.

OpenClaw Discord AI Moderator

- Built a Discord AI moderator prototype using OpenClaw to test whether AI agents could support real community moderation workflows.
- Designed moderation flows for detecting inappropriate messages, generating warnings, respecting admin authority, and handling tagged 24/7 assistant responses.
- Created two AI personas, including a crypto technical assistant and a football analysis assistant, to evaluate response quality across fast-moving discussion topics.
- Implemented 24/7 assistant response behavior for tagged messages, enabling the bot to answer community questions and support repetitive moderation tasks.

EDUCATION

Hacktiv8

Full Stack JavaScript Immersive Program

Jakarta, Indonesia

October 2024 – February 2025

Vocational High School Nurul Huda Baros

Multimedia

Serang, Indonesia

2020 – 2023

CERTIFICATIONS

- Cloud Practitioner Essentials | [Certificate Link](#)
- Problem Solving | [Certificate Link](#)
- SQL (Intermediate) | [Certificate Link](#)
- React.js | [Certificate Link](#)
- JavaScript (Intermediate) | [Certificate Link](#)
- Node.js (Intermediate) | [Certificate Link](#)

Skills

- **Languages** (JavaScript ES6+, TypeScript)
- **Front-End** (React.js, Next.js, React Native/Expo, Tailwind CSS, shadcn/ui, Vite, React Context API)
- **Back-End** (NestJS, Node.js, Express.js, Prisma ORM, Sequelize, REST APIs, GraphQL)
- **Databases** (PostgreSQL, Supabase, MongoDB, Redis)
- **Real-Time** (Socket.IO, Stream chat/voice/video)
- **Auth** (Supabase GoTrue, JWT, OAuth/PKCE, session management)
- **Payments & Integrations** (Xendit, Midtrans, Discord REST API/Webhooks, Stream Chat/Voice/Video, Resend)
- **SEO & Indexing** (Google Search Console, sitemaps, JSON-LD Schema, Open Graph, metadata)
- **Cloud & Deploy** (AWS, Firebase, Cloudflare, Heroku, Vercel)
- **DevOps** (Gitflow, Docker, GitHub Actions)
- **Tools** (Git, Postman, DBeaver, MongoDB Compass)
- **Testing & Quality** (Jest, unit/integration testing, linting—ESLint/Prettier, Postman)
- **Problem-Solving** (debugging, root-cause analysis, performance optimization, legacy-code refactoring)
